## Keeping those pests at bay... Hydra-Cell helps control infestation

Bulk grain storage facilities provide an ideal breeding ground for weevils and other pests. In Australia, an environmentally safe control agent called 'Driacide' is used to sanitise these storage silos and sheds. The product is 90 - 95% metasilica and, consequently, very abrasive. It is mixed with water and applied at 250 PSI. The material dries and leaves a residue. When the insect comes in contact with this material, their protective wax coating becomes damaged and they dehydrate— giving safe non-toxic control of this pest problem.

Hydra-Cell pumps were selected for the application because of their smooth delivery, their ability to handle abrasives, and if necessary run dry without detriment.
